

Abstract

The invention provides a tongue vacuum cleaner that consists of a cleaner head having a dirty inlet facing the surface to be cleaned is mounted on a body that contains a separating filter that separates bacteria and rotting particles from an airflow entering the tongue vacuum cleaner by way of dirty air inlet.

The dirty air goes into a refuse storage means, which is adapted to be removably mounted in the device. The storage means keeps the refuse letting the clean air pass out of the device from the bottom. After cleaning the tongue the refuse means is removed and the waste is washed away in the washbasin.
